

M4-A1

"First Variant"

Topic 1: Li-Po battery capable of being mounted inside the BM Type Stock Tube (Mil-Spec size).

We changed the conventional commercial grade Stock Tube to a Stock Tube that has the same outer dimension as that of Mil-Spec size. At the same time, we made it possible to incorporate a Li-Po battery within the Stock Tube. Because it can be equipped with the battery size of up to 11.1V/1100mAh 30C, hence even if the exclusive MAX M150 cylinder was used, there would be no signs of stress at over 18 seconds of constant fire. To gain access to the battery, simply remove the stock, open the stock tube end cap, then turning the battery.

This removes the need for any tools, therefore even during a game if the battery is depleted it is possible to immediately exchange the battery.

This product can be sold as a set with the BM Type Stock as well.

Topic 2: The inclusion of the 2012 Li-Po capable Switch Device.

With the length of the component shortened, the 2012 Switch Device along with the TW5 Circuit Board has been improved for a high accumulation rate. Not only has the Switch Device become smaller, proper spacing was secured for the case housing the MOS-FET to allow for proper dissipation of heat preventing overheating; thus ensuring a high level of durability. For the battery connection; we employ a very reliable Micro T connector.

※This product may also be sold separately.

For those who currently have the earlier models, it is possible to use the Li-Po battery (with the limited model Micro T connector).

Topic 3: BM Type Stock

This faithfully replicates the appearance of the original Bush Master M4 Stock. With high quality resin used; every stock is bead blasted after removed from the molding process. The Stock Tube is exact in the total dimensions.

※This product is possible to be sold separately as the BM Type Stock Tube set. An exclusive stock tube cap is enclosed.
